The Global Differential GPS (GDGPS) System

Providing mission-critical, real-time services, 24/7, since 2000

Full GNSS capabilities: GPS, GLONASS, BeiDou, Galileo, QZSS, NAVIC

Customer-supported by NASA, industry, DoD

Real-Time Tracking Network
(200+ sites)

Measurements

Triple Hot Redundant Operation Centers

Products, Services

GNSS Monitoring

Precision Industrial
Positioning

Personal
Geolocation

Prototype system and testbed for Next Generation GPS Control Segment (OCX)

Time-critical environmental monitoring services

Repeat path interferometry
with UAV-SAR

Earthquake monitoring
and tsunami prediction

Radio Occultations for
weather forecasting

Space weather monitoring

Two Decades of GPS Performance Monitoring for USAF GDGPS

RMS URE (this snapshot):
0.53 m
Median URE: 0.33 m

32 GPS in view (108 sites reporting)

Page generated on Sat Nov 16 18:31:28 2019 (UTC)
Data Epoch: 28 seconds prior to page generation, Sat Nov 16 18:31:00 2019 (UTC)

Mean AOD
(Age of Data)
11.5 hours

Healthy sats only

GDGPS monitors inter-signal biases (aka differential code biases) for GPS, BeiDou, and Galileo

JPL's *Tgd* inter-signal bias estimates have been broadcasted by GPS for two decades

Special high rate tracking required for monitoring GPS flex power impact on signal biases

- Onset of regular Flex Power regime in January 2017
- Occasional other Flex Power regimes
- Induced signal biases adversely impact precision orbit determination and positioning applications

C1C-C1W estimates for GPS72

GDGPS Vertical Ionospheric Delay at 16-Nov-2019 19:40:00 UTC
In meters at L1

Tsunami monitoring in the Pacific through ionospheric sensing

Global Earthquake monitoring

Situational Assessment and Mitigation of Threats to GPS Applications with the GDGPS System

Threats include:

- Integrity failures
- Jamming
- spoofing (of ranging signals and broadcast message)

Approach:

- Use global and regional real-time monitoring networks; exploit the inherent resiliency of globally-tracked GPS
- Authenticate GPS signals based on unspoofable, unjammable GDGPS System
- Apply classical monitoring and big data mining techniques

Beneficiaries:

- Responsible agencies (for example, DHS, DOT)
- Connected users (for example, power grids, communications grids)

Threats	Mitigation Leveraging GDGPS
Global	
Taking over a GPS satellite	<i>Global integrity monitoring</i>
Regional (~500 km)	
Spoofing, jamming	<i>Centralized situational assessment</i> using existing GDGPS tracking sites; incorporate hundreds of existing U.S. tracking sites <i>Monitor:</i> SNR, range measurements against established models, patterns (multipath, residuals,...), clock jumps, regional comparisons <i>Big data, crowd-sourcing situational assessment</i>
Point	
Spoofing, jamming	<i>Connected sites get information, validation from a trusted source:</i> Nav messages, ephemeris predictions (already used by millions of cell phone users) <i>Smarter receivers:</i> RAIM, signal analysis,...

NGS CORS Network

Galileo Overtakes GPS in Support of Civilian Applications

Civilian applications appear as low priority for GPS; Galileo steps up to the challenge

Capability Promoting Precision Civilian Applications	GPS	Galileo
Laser retro reflectors	No (to be reintroduced with SV11)	Yes
Antenna phase calibrations (Earth coverage)	Not for GPS III Some for Block IIR (courtesy LM; inconsistent with science community calibrations) None for Block IIF	Yes (Consistent with science community calibrations – about to be adopted as standard for terrestrial reference frame)
Attitude model	No	Yes
Radiation pressure properties	No	Yes
Signal in space accuracy (URE)	~0.5 m RMS ~0.4 m Median	~0.4 m RMS 0.2 m Median
Mean Age of Data (AOD)	~12 hours	Less than 1 hour
Stable transmit power; stable inter-signal biases	No (Flex Power)	Yes

Going forward, GPS IIF is considering designs that may further degrade science applications

Existing global and regional GPS tracking networks, technologies, and operational capabilities enable effective mitigation to some threats to sensitive GPS infrastructure at the U.S. and beyond

- Centralized situational assessment of RFI attacks
- Trusted data services to monitor/replace the broadcast ephemeris
- ‘Smarts’ can be implemented outside the receiver, and be both distributed and centralized

GDGPS real-time augmentation and situational assessment capabilities extend to all GNSS

Why wait for a more perfect system to enhance infrastructure resiliency?

- Learn from the DoT interminable quest for a perfect civil signal monitoring service

Will GPS become a backup system to Galileo in civilian application?

- Has GPS given up on maintaining leadership in civilian and science applications?
- Will geodetic standards, used operationally by GPS (e.g., ITRF) be referenced to Galileo?
